

Make the detail do the work.

Six source examples, two commercial teasers and a How To treatment.
Specific frames, specific editing decisions.

Six annotation examples.

Selected from six projects in the supplied Branding folder. Each review uses sampled frames at roughly 25% and 65% of its clip. The editor directions below are proposed changes.

Source sample / 2.74s

Sakti / Travel Hook

What is in the frame

The aerial supplies a clear island setting. White leader lines connect labels to features, while the volcano inset introduces a second visual system.

Re-direction

Lead with the destination, then reveal one surrounding feature at a time. Replace the inset with a full-frame cut if the volcano is essential.

Editor brief

Track anchors to features, keep leader lines thin, use one headline scale, and hold each complete label before the next reveal.

Timing and motion notes are recommendations informed by sampled frames; this is not a frame-by-frame playback audit.

Source sample / 0.94s

Fabienne / Comp 13

What is in the frame

Aerial island imagery is paired with lease/price text and an oversized boat-time statement. The blue lower text loses contrast over the sea.

Re-direction

Choose either the location/access hook or the commercial offer for this shot. Put the other on the next frame with approved terms.

Editor brief

Use a solid caption field for factual text. Avoid competing italic headlines. Do not restate the price or travel time as a current verified offer.

Timing and motion notes are recommendations informed by sampled frames; this is not a frame-by-frame playback audit.

Pengantap / Anotation 1

What is in the frame

A white outline and tinted land area identify the site. The beach marker helps orientation. Small animated blocks compete with that useful information.

Re-direction

Keep the boundary and one beach label. Introduce additional data only after the outline is understood.

Editor brief

Track the boundary carefully. Reduce fill opacity, retain terrain detail and keep the label outside the busiest area.

Timing and motion notes are recommendations informed by sampled frames; this is not a frame-by-frame playback audit.

Source sample / 3.55s

Bongketmolo / Plot 12

What is in the frame

The plot label and road path make the site easy to follow. The smaller area line sits over texture and is harder to read.

Re-direction

Keep plot, area and access in that order. Give the area its own compact solid label and reduce the road emphasis once its route is established.

Editor brief

Use consistent units, one label family and stable anchors. Verify the source area and road-width claims before sales use.

Timing and motion notes are recommendations informed by sampled frames; this is not a frame-by-frame playback audit.

Source sample / 9.69s

Anjuna / On Progres

What is in the frame

The early sampled frame shows large fragmented status lettering over construction. In the later sample, the camera is closer and the lettering has left the view.

Re-direction

Use a concise “Construction update” label and a confirmed capture date. Keep it readable for a deliberate hold before moving into detail.

Editor brief

Anchor the title to a safe screen area rather than breaking it across the building. Cut after the status has been read.

Timing and motion notes are recommendations informed by sampled frames; this is not a frame-by-frame playback audit.

Source sample / 1.24s + 3.23s

Sumba / Anotation 2

What is in the frame

Three location labels, circular anchors and an ornamental symbol share the frame. The project is not clearly more important than nearby destinations.

Re-direction

Make the project label primary. Use quieter secondary labels for surroundings and remove the decorative symbol from the information layer.

Editor brief

Keep anchor sizes consistent. Separate nearby leader lines. Reveal the project first, then the two context points.

Timing and motion notes are recommendations informed by sampled frames; this is not a frame-by-frame playback audit.

Source sample / 1.62s

Two commercial teasers.

Anjuna CTA

The samples move from people holding devices to an aerial with large “80+ shops” text and colored project zones. That connects a human entry point to project information.

Make the value the hook. Open with the question the update answers. Then show one dated phase change. Keep the project-zone colors subordinate to the footage and finish with a tour invitation.

Proposed edit: question → current capture → one phase change → open the tour. Confirm the “80+” claim and capture date before use.

Kibarar CTA

The sampled interior and exterior frames use short central words, including “Capture” and “Before”. The space is strong; the message is incomplete when a frame is seen alone.

Give the place a complete thought. Use one short sentence across a readable hold, then let the route show the relationship between interior and surroundings. Sign with the same Meta Pacific mark at the end.

Proposed edit: “Understand the space before the visit.” Interior route → exterior context → tour link.

Both source clips report approximately eight seconds. Two sampled frames per teaser were inspected. These are edit briefs, not claims about audience results.

How To / Show the interaction.

Cemagi / Virtual Tour

The source uses a blurred room background, an inset tour view and “Make every space accessible”. It communicates the category, but the action inside the tour could be clearer.

Turn the viewer into the operator. Open with the real interface. Highlight one tap, let the destination load, then show where the viewer can go next. Keep captions outside the interaction area.

Repeatable format: one question → one action → one result. Additional episodes: return to overview, compare a phase, identify a render, share a viewpoint.

A proposed How To format based on the Cemagi sample, not a claim that the full series has been reviewed.
