

08 / Landing-page direction

From a good shot to a clear next step.

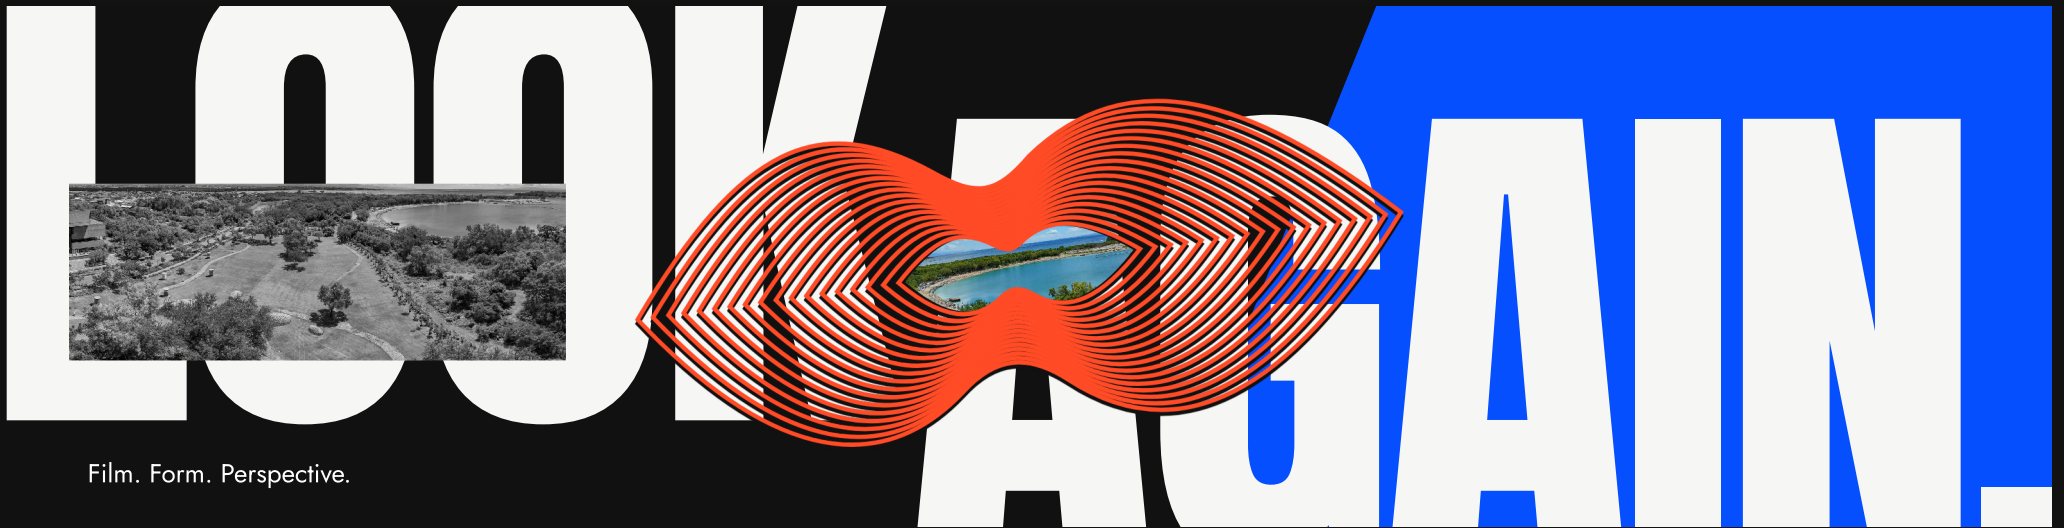

A complete company homepage with three identity-led treatments. The company site is an application of the brand, not the assignment navigation.

A company homepage, not another task page.

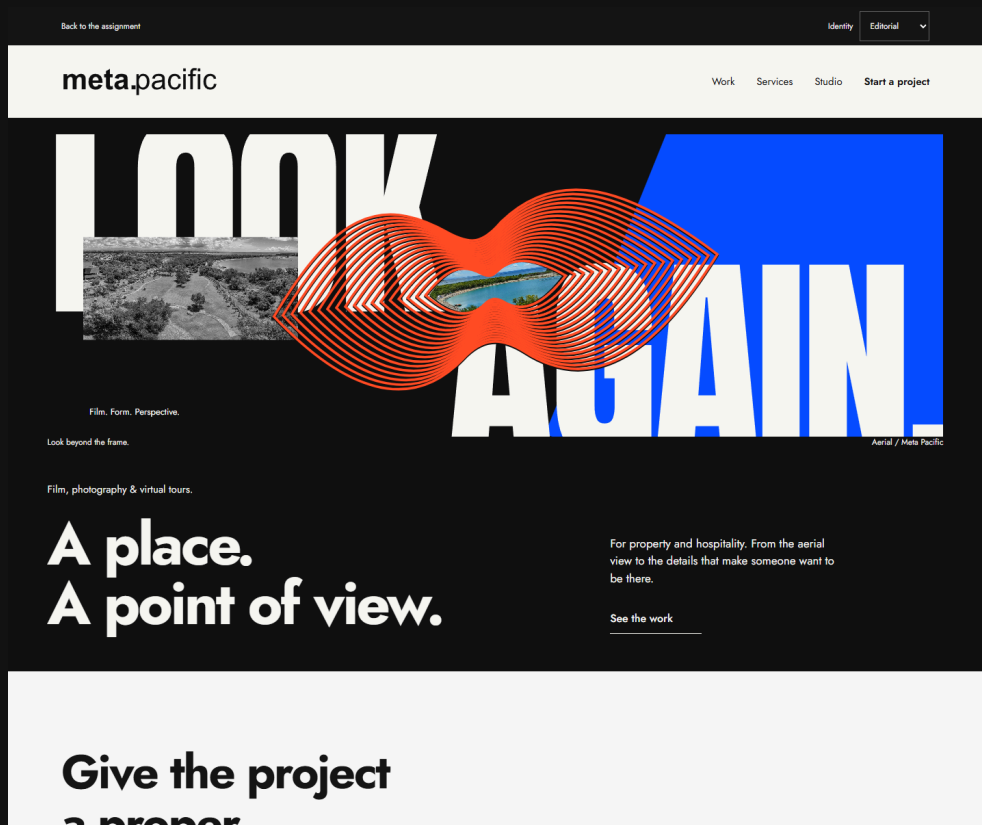

The assignment explains the decisions. The landing page lets a prospective client see the work, understand the services and start a conversation.

[Open the landing page](#)

Use the identity selector at the top to compare Editorial, Signal and Studio. The selected direction stays in the URL.

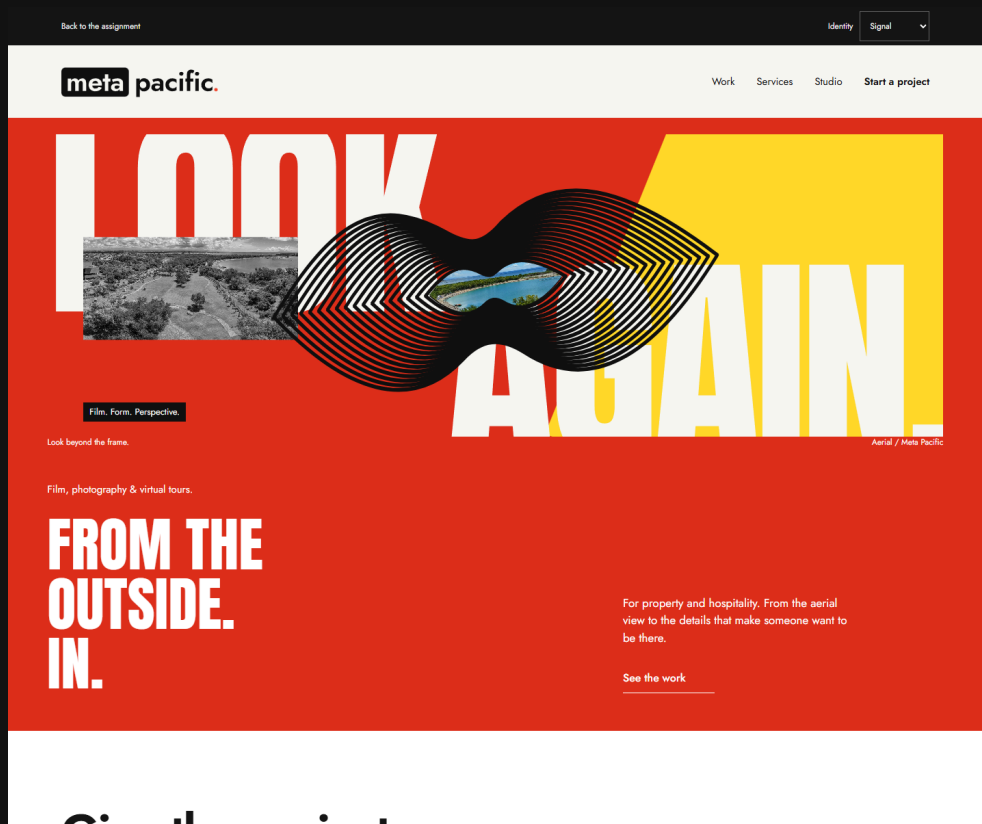

Three identities. Three opening rhythms.

Editorial

A moving graphic opening.

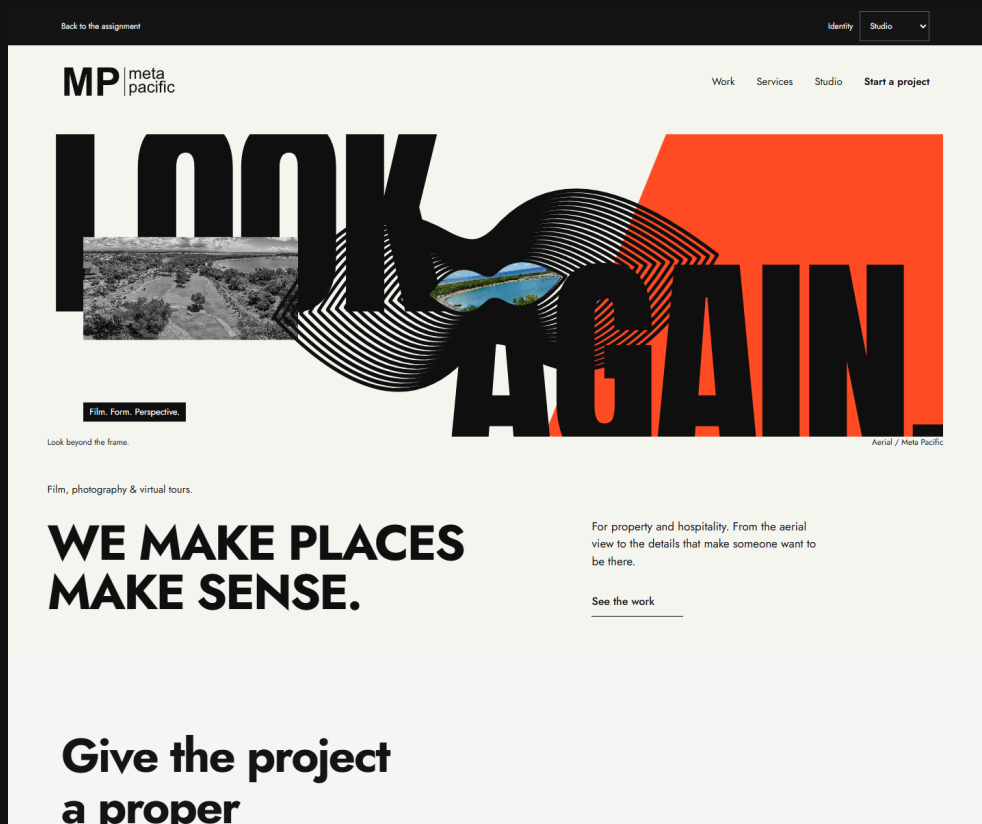

An ink field, orange contour lips and cobalt cuts introduce the work. The clear business message follows below. Recommended for the primary company site.

A stronger campaign opening.

A red field, yellow cuts and black contours give the contained wordmark a more assertive setting. Upright condensed type carries the message.

Signal

Studio

The production studio, up front.

A white field, black optical contours and a vermilion cut put production craft first. The compact MP mark stays separate from the message.

The path from interest to a brief.

Introduce

An automatically animated graphic composition, followed by a clear business message. The logo and essential text remain separate from the artwork.

Explain

Three service groups, with detail available when it is useful.

Show

Selected projects, followed by an Anjuna tour the visitor can open.

Meet

Christobal Grego and the working process, without an invented quote or portrait.

Scope

A launch package or an ongoing relationship, followed by one contact action.

Motion that starts itself. Contour lips deform continuously. Oversized display lettering, a color field and photographic cutouts move in layered loops without scrolling. The business headline and controls stay still. A pause control sits in the footer. The Anjuna sequence changes the preview from setting to phase to proposed interior as the reader scrolls; direct controls remain available. Phones show the three views inline. Reduced-motion preferences remove the animation without removing the content.
