

12 / Anjuna Virtual Tour case study

A place you can understand before visiting.

Turn a complex tour into a guided decision: where it is, what exists, what is proposed, and where to go next.

Start with orientation.

The opening panorama locates the project in its wider setting. That is a useful first answer. The next layer should help a viewer distinguish existing land, construction progress and proposed interiors.

Recommended entry point. Open on the area view, identify the project once, then offer a small choice: explore the land, inspect the phases, or view the proposed villa. Avoid making the first screen explain every feature at once.

From land to proposed space.

Master view

The outline connects Palms, Village and Aurora to the coast. Masterplan, video and contact controls share the view. Keep the site boundary primary; group secondary actions.

Palms / phase context

The scene shows construction, named zones, bedroom options and a September 2026 viewpoint. Preserve that date. Replace file-like scene names with plain visitor labels.

Proposed villa

The linked one-bedroom scene shows a finished-space visualisation. Add a persistent “Proposed / render” label so the change in evidence is clear.

The useful interaction is the comparison. Use the master view to orient, the phase view to explain what exists, and the villa visualisation to show what is proposed. Keep a clear return to the parent scene. The scene counter shows 176 views; a first-time visitor needs a guided starting path, not a full archive at once.

Selected linked scenes inspected on 13 September 2026. Source labels are reported as shown, not independently verified construction dates. Contact and external video actions were not submitted or followed.

One communication concept / Before the visit.

Where is it?

Area view. One project marker and a readable route. Keep the surroundings visible.

What exists now?

Show dated site capture. Separate construction footage from future visualisations.

What can I explore?

Demonstrate a hotspot, then open the tour. Label render views as proposed.

Why a guided carousel plus tour. The carousel answers the first questions without asking the viewer to learn a new interface. The tour then gives control to someone who wants more detail. The two formats do different jobs.

What to emphasise in the product.

Navigation

A visible way back to the overview. Clear scene names. One featured interaction at a time in promotional screen recordings.

Embedded information

Use short, purposeful hotspots. Put longer specifications in an expanded panel rather than over the entire panorama.

Open the supplied Anjuna tour

Evidence: opening panorama, master and Palms scenes, a linked one-bedroom visualisation, and selected Anjuna source frames. Recommendations for phase navigation and render labels are design proposals, not a claim that every scene or hotspot has passed a full audit.

Phases & renders

Keep current capture, progress and proposed spaces distinct. Add capture dates and source labels before making sales claims.

Next step

Invite a project review or a visit after exploration. Do not interrupt navigation with repeated enquiry prompts.
